

Input memory 101 stores input data. Row pattern memory 102 stores row patterns. Column pattern memory 103 stores column patterns. Output memory 104 stores output data with the sequence of the input data rearranged. Address calculation apparatus 105 calculates addresses of the input data to be written to the output data and further writes input data read from input memory 101 in output memory 104 as output data based on the calculated input addresses.
